

F O R E W O R D

The United States is considered to have the best agricultural statistics in the world. By the same token, Florida is credited with having the best vegetable statistics in the United States. Moreover, these statistics are constantly being improved and made more comprehensive to meet the demand for more accurate and precise information. Farmers, businessmen, administrators, and legislators have come to rely more and more on statistics--to tell them what is happening, to show them where their economic problems are, and to assist them in finding answers. Statistics also serve as guidelines both for current activities and for planning ahead.

To be of value, statistics must be used. To be used properly one must know what they represent. What definitions are used? How the data are obtained, tabulated, and analyzed? What is their degree of accuracy and reliability? And finally, one must guard against misinterpretation and attempts to make improper application.

The purpose of this publication is to present in summary form the more important and basic information that growers are likely to need in planning and analyzing their individual operations with respect to production and marketing problems. Complete historical data serve as a benchmark for plotting a future course. Their greatest value comes with an understanding of the past and an alertness for discerning the future. The Crop Reporting Service, also issues monthly reports on the acreage and potential production of vegetable crops by seasons (fall, winter, spring, and summer.) This timely periodic information when properly used should encourage judicious planting and more orderly marketing programs. The ready availability of facts, both current and historic, should exert a much needed stabilizing influence in an industry that is very sensitive to either real or imaginary changes.

ACKNOWLEDGMENT OF CONTRIBUTORS

Through the joint efforts of the Florida Crop and Livestock Reporting Office of the Agricultural Marketing Service, U. S. Department of Agriculture and the Department of Agricultural Economics, Agricultural Experiment Stations, University of Florida, data are presented on the acreage, production, and value of 17 vegetable crops.

With the exception of the shipment information, the data contained herein are estimates and are based on reports by, and interviews with growers, shippers, marketing associations and organizations, seedsmen, railroad representatives, canners, and other processors. We gratefully acknowledge our indebtedness to each person and organization contributing to the development of these data.

We further acknowledge the assistance extended by such agencies as the Florida State Marketing Bureau, the Agricultural Extension Service through its county agricultural agents, the Federal-State Inspection and Market News Services, the Florida State Marketing Board, the State Plant Board, and other informed sources.

Much credit is due to our entire clerical personnel for the painstaking work they have done in preparing this booklet for publication. Arlene Kruse and Doris Schankweiler handled most of the assembling of data and the cutting of stencils.

USERS OF AGRICULTURAL STATISTICS

Agricultural estimates are, first of all, released by the Government to the farmers, businessmen, consumers, and others who must make a wide variety of individual decisions, based on the best facts obtainable. The same estimates are also used by the legislative, judicial, and executive branches of Federal and State Governments in many different ways. Some of the leading uses are by:

1. Individual farmers; in working out their planting, breeding, feeding, and marketing programs.
2. Farmers' service organizations in keeping abreast of current agricultural problems and in determining their policies.
3. Farmers' cooperatives; in planning their purchasing, sales, and marketing programs.
4. Processors, dealers, and handlers of agricultural products; in planning where to establish their plants, determining the source and volume of their raw products, and the size of their operations, and in marketing their products.
5. Railroads and other transport services; in determining the number of cars and trucks needed to move the agricultural products of particular areas. The statistical data on production and time of harvest enable these carriers to distribute their equipment where it is most needed. This is especially important with perishable products such as fruits and vegetables.
6. Operators of warehouses and other storage facilities; in planning storage for each year's crops and livestock products.
7. Industrial organizations, manufacturers, jobbers, merchants, and mail-order houses, particularly those with farm customers or customers processing or packing farm products; in planning their production, sales, inventories, and advertising programs, in order to provide the farmer with goods he needs when he needs them.
8. Banks, insurance and credit organizations; in calculating the risks in financing farm production, storage and marketing; in managing farm properties under their control; or in insuring farmers against crop failures, livestock losses, and so on.
9. Editors and writers for farm and trade papers, newspapers, and radio service; in developing background for articles and programs of timely interest and value to farmers.
10. The President and his Council of Economic Advisers; in reporting on the several sectors of the national economy, including agriculture and recommending policies and legislation.
11. Members of Congress; in shaping nearly all legislation directly affecting agriculture, and much of the legislation affecting the general economy.
12. Department of Agriculture; in gauging the adequacy of production of foods and fiber for the nation's essential requirements; in administering action programs of the Department; in determining income from agriculture; in measuring prices of farm products in relation to prices of other commodities; in determining parity prices which are basic to virtually all price support and acreage control programs enacted by the Congress; as basis for actuarial tables used by Federal crop insurance program; in determining price supports and, during World War II, the minimum points at which price ceilings were permissible; in the planning and operations of credit, conservation, educational, and other programs; in appraising the need for and results of various physical and economic research projects; in maintaining a current economic outlook service for farmers and others interested in agriculture.
13. Department of Defense; in planning for and carrying out the procurement of farm-derived commodities needed to feed, clothe, and otherwise equip the Armed Services.
14. Department of State; in helping to negotiate commercial agreements with foreign governments; in overseas information programs; in programs of economic and technical aid to foreign countries.
15. Department of Labor; in appraising changes in the relative position of labor and other segments of the economy, including agriculture; in appraising migratory labor requirements by the United States Employment Service.
16. Department of Commerce; in certain business advisory services and in planning and executing programs that affect the general economy; by the Interstate Commerce Commission in establishing or revising rates affecting transportation of farm products.
17. Department of Health Education and Welfare; in programs of vocational education in agriculture; in administration of purefood laws; in social security and other programs affecting farmers or farm laborers.
18. Department of the Treasury; in planning and carrying out tax programs that affect agriculture; in selling U. S. Savings Bonds in rural areas.
19. Department of the Interior; in planning and executing programs of reclamation and land management. The Fish and Wildlife Service, in management and conservation programs.
20. State governments; in the operation of various marketing, regulatory, and other programs affecting agriculture, agricultural products or related industries or interest.
21. State agricultural colleges and extension services, State and county extension workers and others; in advising farmers about plantings, breeding, and marketing operations and farming operations in general. Statistical data are the basis for their educational programs, and also measure the effectiveness of their crop and livestock work.

Many additional users and uses could be cited; the foregoing list gives only a broad outline of the significance of an adequate agricultural statistical reporting program to the national economy as a whole, and to the economy of agriculture in particular.

I N D E X

Each crop generally carries the following sequence of data by season: Name of crop - Season; Acres for harvest by counties; Acreage, production and value - State summary; Acreage and production by counties and areas, 1958-59; Average monthly prices, and shipping data. Crops that harvest in more than one season are then combined in one total grouping classified as "all" and placed before the breakdown by seasonal groupings.

BEANS, LIMA	1 - 2	LETTUCE	40 - 42

ESCAROLE and CHICORY	38 - 39	ALL CROPS (Summary)	86 - 87

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPINGS - In order that competitive production within the State of Florida and the United States may be classified on a National basis under reasonably uniform groups, we have established a National pattern which is based on the most active harvesting periods. These major groups are WINTER, SPRING, SUMMER, and FALL. The WINTER group includes the months of January, February, and March; SPRING includes April, May, and June; SUMMER includes July, August, and September (Florida carries no official summer commercial crops); and FALL includes October, November, and December. These periods are not rigidly fixed and the harvesting period for a particular grouping may extend into the preceding or following group. However, in arranging our data we have followed these groupings in so far as it is practical. For example, it has been considered practical to carry cabbage, cauliflower, escarole, lettuce, and strawberries as one season crops, designating them WINTER since the volume production is harvested generally during January, February, and March. Since some systematic order of grouping is necessary it is deemed best for all concerned to handle our classifications on a National basis even though they may not always agree with some local designations now in use.

PLANTED ACREAGE - The definition for planted acreage is based on a "loss of crop" concept. Estimates of planted acres for any seasonal grouping consist of acres for harvest (see next paragraph) during that particular seasonal group plus any acreage planted for harvest during the season, but which was lost or destroyed and did not produce a crop in the season under consideration. If the acreage is lost and not replanted it is counted as planted. If it is lost but replanted for harvest in the same season as the original acreage would have been harvested, the acreage replanted is not considered as additional acreage planted. However, if the acreage lost is replanted for harvest in a later season, it is considered as planted for both seasons and as acres for harvest only for the latter season.

ACRES FOR HARVEST - This is considered as being all acreage from which a crop could have been harvested had economic conditions (prices, available labor, etc.) warranted the harvest. It includes mature acreage on which the harvest was postponed or delayed too long due to economic reasons and the production lost thereby. Acreage which produces such low yields or poor quality that the crop is not worth picking at any reasonable price is considered as crop failure and is not included in the acreage for harvest. Unharvested acreage which produces yields which would be harvested at reasonable prices is included in acreage for harvest.

YIELD - Yield refers to total production of merchantable quality produced on an acre basis and may include some unharvested production left in fields for economic reasons.

PRODUCTION - Total production represents the yield times (\times) the acres for harvest. Production of value is that part of the production which was harvested and sold or utilized and does not include economic abandonment.

ECONOMIC ABANDONMENT - This category includes mature production not harvested because of economic factors, such as low prices, shortage of labor, etc. Such loss of production includes quantities left in fields partially harvested as well as production on acreage abandoned for economic reasons. In the production tables in this book economic abandonment is the difference between the total production and the production of value.

Acreage abandoned at any stage of growth before maturity will be considered as loss of acreage or crop failure rather than economic abandonment of production.

AVERAGE PRICE - All prices used in this report are per hundredweight on an f.o.b. basis or its equivalent, less selling charges. (Comparable average prices per standard unit is shown in parenthesis).

TOTAL VALUE - The total value is the average price per hundredweight times the production of value.

CANNED OR PROCESSED ACREAGE AND PRODUCTION - The acreage of vegetables in Florida planted solely for canning and other processing purposes during the period covered by this publication has been confined principally to cucumbers for pickles. The acreages of beans and tomatoes, the principal crops processed, are planted primarily for fresh market, but each year substantial quantities are canned or frozen.

In order to show the utilization of the production from the acreage brought to harvest, three columns on production are used in the State Summaries. The first shows the total production, the second shows the production sold for fresh market consumption, and the third shows the production sold for processing (either canned or frozen). Production abandoned for economic reasons is the total production minus the sum of the production for fresh market and processing.

Those desiring to know the equivalent acreage utilized for processing should divide the number of hundredweight processed by the average yield then generally round to the nearest hundred. The prices given for processed beans and tomatoes are based on a per ton price and reduced to a per hundredweight price (rounded to the nearest whole cent).

MIXED CAR MOVEMENT - Total shipments of produce in mixed cars are shown by months on Page 74. These data include the equivalent cars shown in our regular shipment data under each specific crop carried in this publication.
